Background

Apart from the classic monography by Fourbister, only few studies about Carcinosin are available. Therefore we analysed the clinical cases treated with Carcinosin in a single institution.

Patients

n = 202 cases between 2007 & 2013
n = 176 📈 n = 26 ♂ ♂ ♂ age: 44.5 (4-84)

Conclusion

Our study demonstrates that Carcinosin is a long-acting remedy with a wide range of indications. It often replaced successfully Lycopodium which has certain similarities with Carcinosin. We find it to be a useful polychrest if no active cancer is present.
